

## HOW IT WORKS

From your online Customer Portal account, manage employees, containers, piece rates, and other harvest settings.

Use the Registration Station app on an office PC to assign Employee RFID Badges and create Configuration Cards to program the Weighing Station with specific harvest and container settings.

During harvest, Pickers weigh produce at a Weighing Station and receive credit for produce picked when they scan their Employee Badges. The Weighing Station records other harvest information including date, time, and GPS locations.

At the end of the day, bring the Weighing Station back to a location with the FairPick router and power for charging. Harvest data transfers wirelessly through the router directly to the internet via wifi, or through the router, onto the Handheld, then to a location with a wifi internet network.

View uploaded data on your Customer Portal account. Download Weigh Log, Daily, and Pay Period reports in CSV (comma separated values) format to easily do your payroll. CSV files import directly into most accounting/payroll software packages.
